

Multi-Component Dark Matter through a radiative Higgs Portal

Gopolang Mohlabeng

Ph.D. Candidate

Department of Physics and Astronomy

University of Kansas

We study a multi-component dark matter model where interactions are primarily via the Higgs boson. The model contains vector-like fermions charged under $SU(2)_W \times U(1)_Y$ and under the dark gauge group, $U(1)'$. This results in two dark matter candidates. A spin-1 and a spin-1/2 candidate, which have loop and tree-level couplings to the Higgs, respectively. We primarily explore the resulting effect on the dark matter relic abundance, while also evaluating constraints on the Higgs invisible width and from direct detection experiments.
