Research Activities

Since June 1982 - Physics Department, University of Notre Dame

Current research interests are nuclear incompressibility and the equation of state of dense nuclear matter, and exotic quantal rotation in nuclei. Experiments are carried out at the ATLAS accelerator facility at Argonne; RCNP, Osaka, Japan; RIKEN, Japan; GANIL, France; and TIFR, Mumbai, India.

Important recent accomplishments include the discovery of the isoscalar giant dipole resonance, an exotic mode of nuclear deformation, and elucidation of its properties; experimental determination of the nuclear incompressibility and the asymmetry term; first observation of transverse wobbling in nuclei; first observation of tidal waves in nuclei; first observation of a composite pair of chiral rotational bands, and affirmation of chirality in odd-A nuclei; and, first observation of multiple chiral bands ($M\chi D$) in nuclei.

Led the Notre Dame effort in the construction and operation of the Notre Dame/Argonne BGO Detector System for use at ATLAS. This device consisted of a 50-element BGO "ball" surrounded by 12 Compton-suppressed Ge detectors.

Led the effort in the design, fabrication, testing and installation of a state-of-art RDM device for use in conjunction with Gammasphere.

Nov. 1978 - May 1982 - Research Associate, Texas A & M University

Research work involved experimental studies of giant resonances, especially the isoscalar breathing mode state, using inelastic alpha- and heavy-ion scattering, and spectroscopic studies of nuclei using "massive transfer" reactions. An important accomplishment was the discovery of the splitting of the giant monopole resonance in deformed nuclei.

Sept. 1974 - Nov. 1978 - Graduate Assistant, S.U.N.Y. at Stony Brook

Thesis work involved experimental studies of high-spin states and band structures in the $Z > 50$ transitional nuclei using the techniques of in-beam γ -ray spectroscopy following (HI, $xpyn$) reactions. An important accomplishment was the observation of band structures built on deformed $9/2^+$ proton hole states in the light-mass Cs nuclei.
