**4:00 P.M. NSH 124**

*GoLIMS* is a cloud-based laboratory information management system (LIMS) specifically designed for small to medium-sized research laboratories. We provide infrastructure to centrally organize research projects, develop electronic notebooks, inventories, and essential files in an always available platform for all researchers.

Academic and professional researchers deal with a daily flood of information they must collect, decipher and maintain records for continuing research. On any given day, a Principal Investigator and their team must record what experiments are run, when, and by whom; all the while collecting the results in an organized way to allow for the easy retrieval of accurate records.

*GoLIMS* solves this problem by providing an immediately available, subscription service that saves money by eliminating expensive hardware, software, and IT expenses. By leveraging cloud storage and implementation we provide researchers securely hosted data that is available on any platform from anywhere at any time. We have developed a unique system that connects all of this disparate data in a central system focused on necessary functionality. Furthermore, we focus on service, helping to configure and customize different aspects of the system based upon the data collection needs at hand.

**Nuclear  
Seminar**

**All interested  
persons are  
cordially  
invited to  
attend.**
